# Locomotive Battery Saver

Extended locomotive battery life.

When a locomotive is shut down manually, non-essential circuits can drain the locomotive batteries and result in dead batteries or reduced battery life. With the Locomotive Battery Saver™ System, a contactor simulating the main battery disconnect switch will open automatically after a preset time delay. At any time after these loads have been shed, they can easily be reinstated by pressing a backlit reset button or restarting the locomotive. The Locomotive Battery Saver System is compact in size and easily mounted in the electrical cabinet.

Reduce dead battery occurrences and **extend battery life** with a rugged, **cost-effective** Locomotive Battery Saver System
